

Fetching GH issues

Requirements

1. Install **Git CMD**
2. Install command line package **gh**

Steps to fetch issues of github repository as JSON file

1. Create a directory and set path to the newly created directory
2. Clone the repository using git command “git clone ‘repo URL’”
3. Open cmd
4. Change directory to the cloned repository directory.
5. Extract the repo issues using following command on cmd
6. `gh issue list --limit 10000 --state all --json number,title,assignees,state,url,author,closed,closedAt,createdAt,updatedAt,labels,id,milestone > iotdevicesdk.json`
7. This command will extract the repo issues as json.

Steps to convert issues in JSON format into CSV file

1. Write the python script using python packages pandas and json
2. Load the issues file in json format.
3. Iterate the json and convert it into list of dictionary objects
4. Then convert this list into pandas dataframe, subsequently convert pandas dataframe into comma separated CSV file.

Command Explanation

- `gh issue list --limit 10000 --state all --json number,title,assignees,state,url,author,closed,id,milestone > iotdevicesdk.json`
- `--limit` specifies the number of issues to fetch
- `--state` specifies the state filter on issues all mean all issues (open,closed)
- `--json` specifies that the issues need to be loaded as JSON
- Specifies the attributes of issues like(number, title,assignees)
- `>iotdevicesdk.json` specifies the name of the json file in which issues will be loaded
